AutoCAD's programming language is "AutoLISP", an interpreted, Lisp-like programming language. AutoCAD is available in 32- and 64-bit editions. AutoCAD has several types of entities, each with a particular purpose in a drawing. The most common types of entities in AutoCAD are: Entity types Organizing information about entities. Drawings made in AutoCAD can consist of several files. These files have a common tree of entity types, and may contain multiple entities of a specific type.

Entities may be defined in a separate entity definition file, as either a single entity or a list of entities. Entity files Associating information about entities. The files in a drawing can be organized as a tree of entity files, which are defined in a drawing definition file. Entity types Organizing information about entities. Entity types are used to organize information about entities, such as the name, coordinates, attributes, and so on, of a particular type of entity. The entity definition files in a drawing usually have one or more entity types. The actual definition files in a drawing, which are used to define individual entities, usually have only a single entity type. Entity types are typically stored in the entity definition file in the form of several special types of data structures, called entity types. Entities Organizing information about entities. Entities are drawn by users to represent the data that the users want to display. The data is defined in the drawing as separate objects (called entities) of various types. Each entity can have any number of attributes (characteristics) defined for it. To draw an entity, the user must create one or more entity definition files that associate one or more entity types with the entity. Each of the one or more entity definition files typically specifies the name, coordinates, and attributes of the entity type, and optionally the options for the entity. The options are typically specified as attributes of the entity. (Note that the options in AutoCAD are not equivalent to the user options in a similar way that attributes in GIS software are not equivalent to user attributes in an attribute table.) Use of topical antibiotics for the treatment of infected non-healing ulcers. A significant number of patients with chronic non-healing venous leg ulcers will eventually undergo a change of treatment, either because the ulcer becomes complicated by infection or because the ulcer is closed by surgery. Most of the non-healing ulcers of the leg are secondary to chronic venous insufficiency. Treatment with compression bandaging should be considered when a patient presents with a severe exacerbation of the ulcer. The use of wound dressings and systemic antibiotics is indicated in all patients with a non-healing ulcer that is not responding to other treatments. The use of topical antibiotics in this situation will prevent the establishment of systemic infection and, therefore, reduce the risk of systemic adverse reactions and septicaemia. Topical antibiotics should be applied to the ulcer base and margins every four to six hours. Patients treated with topical antibiotic therapy should be closely observed because of the risk of development of systemic infection.
