Galacticastronomyjamesbinneypdf159

galacticastronomyjamesbinneypdf159 Related From Wikipedia, the free encyclopedia. Document Type: Article. In 1998, astronomers in the United States and Australia determined that an ultra-high-speed object appeared to be associated with the gamma-ray emission from the Active Galactic Nucleus J1833-1034. The object, dubbed a 'gravitational bluebird' by astronomer Bob Wilson, was first discovered in 1992 by a group of US radio telescopes that use tracking instruments. Its velocity is three times faster than that of other known superluminal objects. 'The speed of this object is extraordinarily fast, and one cannot help but wonder if it is a black hole, neutron star, or a previously unknown type of black hole. We have a clear electromagnetic detection of this object in gamma-rays, so we know it's associated with very energetic phenomena,' said Bruce Allen, the lead scientist for the Event Horizon Telescope (EHT) program. The EHT has now assembled a radio array of telescopes to make the first ever image of an event horizon, the gravitational boundary of a black hole. The images produced by this project are expected to reveal more about the properties of gravity at the microscopic scale than any other science instrument on Earth. 'Gravitational wave astronomy is in its infancy, and the first such detection promises to be profound. For the first time, we will have a picture of the shadow on the sky of the most powerful source of gravity in the Universe,' said Stephen Hawking, professor of physics at the Centre for Mathematical Sciences at Cambridge University. 'This is a historic achievement, and a remarkable scientific challenge. I am looking forward to seeing the results from the EHT, not only for the benefit of science but also for the benefit of the millions of people across the world who are fascinated by astronomy. It is a privilege for me to have worked with such an outstanding international team.' President Barack Obama said the discovery showed the power of science to transform the world. 'We are all left in awe of the mysteries of space and the beauty of our universe. The detection of gravitational waves today brings us closer to a new understanding of this cosmos, and by extension, our place in it,' he said in a statement. 'This new understanding will help us answer some of the profound questions of our time, including whether there is a universe beyond the one we see with our eyes, c6a93da74d
