Cricket World Cup 2011 Guide. The present invention relates generally to the field of communications, and more specifically, to facilitating the transmission of data using motion sensors. Mobile communications are prevalent in today's society. For example, the proliferation of mobile telephones, personal digital assistants (PDAs), and other portable devices with wireless communications capabilities has led to the development of complex infrastructures for conveying information and content to the mobile devices. Furthermore, with the widespread use of high speed cellular telephone networks, many businesses and other enterprises have constructed private wireless local area networks to further augment the wireless services with which their employees are provided. As a result, mobile workers have convenient access to many types of communications and other content while they are away from their desk or home. More recently, advances in the field of communications have enabled the integration of personal communications devices into other objects, referred to herein as "mobile" devices. For example, with the advance of radio frequency (RF) communications, "smart" watches, wristbands, and other wearable items can be employed to receive a wireless communication signal and to thereby determine a location of the wearer. Likewise, mobile devices can be provided with a number of other types of sensors, such as, for example, motion, touch, and other sensors, which can be used to provide additional information about the state or environment of the device. The data generated by these sensors can then be transmitted to a server through any of a variety of known wireless communication systems. For example, a user of a wearable device might need to sign into his/her e-mail account or to access other types of content while he/she is on a business trip in a remote location. As another example, a wristband could be used to provide a subscriber with an appropriate alerts as a storm or accident is approaching. 1. Field of the Invention The present invention relates to a method of producing a semiconductor device, in particular, a method of producing a semiconductor device which can be preferably used as a semiconductor device for optical communication, an c6a93da74d
