the aster gdem version 3 data product was created from the automated processing of the entire aster level 1a archive of scenes acquired between march 1, 2000, and november 30, 2013. stereo correlation was used to produce over one million individual scene based aster dems, to which cloud masking was applied. all cloud screened dems and non-cloud screened dems were stacked. residual bad values and outliers were removed. in areas with limited data stacking, several existing reference dems were used to supplement aster data to correct for residual anomalies. selected data were averaged to create final pixel values before partitioning the data into 1 degree latitude by 1 degree longitude tiles with a one pixel overlap. to correct elevation values of water body surfaces, the aster global water bodies database (astwbd) version 1 data product was also generated.

cultivated varieties have colored flowers. a number of hybrid species are available in a variety of colors. wild type species native to your region are generally a wise choice for the ecologically-minded gardener, despite them not being quite as flashy in some cases. a few recommendations for varieties, all of which flower in showy colors, are further down this page. seasonal control of aphids and whiteflies is not necessary, unless you find that these pests are a major problem for your perennials. our species of choice is the non-host plant datura stramonium, a perennial herb that grows in full sun to part shade and can grow over a foot high. it can be planted in every season and is a good source of instant enjoyment if your garden is sunburned in the summer. you could also consider the host plant amsonia habrophylla, a perennial, spreading herb with showy white flowers. weeds, however, do not compete well with annuals, so the presence of perennials in your garden will keep weed seeds from germinating. perennial weeds (eg. white pine, buckwheat, black huckleberry, etc.) and perennials with year-round blooms are generally not a problem, as long as they do not carpet the garden.

Aster V7 6x64 Key

the aster sea/land cover classified (aslc) product layer provides a set of land cover classification schemes that are derived from aster imagery. the land cover classification is based on the modis land cover product with the aim of providing a global, consistent, and reliable framework for applications using aster imagery. this product is also used as a reference for validation of the gdem. the global coverage of this product ranges from the land areas of the united states to the antarctic. the aster sea/land surface temperature and emissivity (aster slstr) product layer provides global coverage of land surface temperature and emissivity. the aster slstr product improves the accuracy and consistency of land surface temperature information by using aster imagery to correct the modis land surface temperature data, which is used to create a reference surface for the aster data. the global coverage of this product ranges from the land areas of the united states to the antarctic. the aster ecosystem product layer (asel) is a set of ecosystem types derived from aster imagery. this product is used to generate a global, consistent, and reliable classification of land cover types. the global coverage of this product ranges from the land areas of the united states to the antarctic. the aster land cover type and land use product layer (aslc) provides information on land cover types and land use. the aster land cover type and land use product layer is derived from aster imagery and is used as a reference for validation of the gdem. the global coverage of this product ranges from the land areas of the united states to the antarctic. 5ec8ef588b
