Assniffer is a simple program which enables the attacker to take snapshots of the pages visited by a user, over a defined number of days (specified in the configuration file). Assniffer extracts the first 200 bytes of each document, and stores the contents in a simple text file. The config file specifies which days to monitor, and what the file name of the file to be generated. The actual data, including cookies, is retained for each visit. Assniffer is written in Perl, and requires no database server.

Assniffer usage: Assniffer can be installed on a single host, or any number of hosts. Assniffer assumes that the hosts it is installed on are up and functional, and does not require a domain name. Assniffer uses the DNS to determine what IP addresses are returned when a host is queried. Assniffer can use reverse DNS records, if you have them, and/or request the host IP addresses from a DNS server (e.g., www.ip-api.com). Assniffer does not modify the hosts it monitors, and does not require root access. For convenience, Assniffer has a short TCP/IP example which will test that Assniffer is working, and help you to get started. The Assniffer test page contains a timer which will update the IP addresses and subnets. Assniffer configuration file format: The Assniffer configuration file has three columns, separated by spaces. The first column specifies the name of the file to be generated. The second column specifies the days of data to be captured. The third column specifies which bytes to extract from each document, and where to store the data. Each line must specify a host, and a day. Multiple lines can be specified to cover multiple hosts. The host can be a subdomain, a domain name, or the IP address of a host. Assniffer must be run to take any data from a hosts. Before starting the program, the IP addresses and subnets for the hosts must be entered into the configuration file. Assniffer configuration file sample: The following lines create the required configuration file. This will monitor the test.com domain for a period of 30 days. The data will be stored in the

Assniffer uses your hosts (and other devices) to discover what's being transferred through the network. If a request is made that uses a particular service, it allows you to passively monitor that data as it's transferred. E.g. If you visit www.google.com, you can see the HTML document as it's transferred, along with the raw data the server sends. If you visit you can see the size, content type, and/or mime-type of the file as it's transferred. E.g. If you visit you can see the size, content type, and/or mime-type of the file as it's transferred. If you visit you can see the query string of the request as it's transferred. So in the event of a DDoS attack, you may be able to see the traffic going out and coming back, which will allow you to make a judgement about what was hit. There are some other scenarios where Assniffer will reveal things, but you have to be very well versed in what's happening on your network, what's being transmitted through the network, and what's being done by the various software components. The Assniffer application was designed to monitor a network, and for every HTTP transfer it sees, save a copy of the transferred data. This is less for sinister uses, and more for taking advantage of the already-transferred data that your computer may be exposed to. What's New in the Assniffer?

Automatically monitor and save data transferred in- and out-of-network using the Windows Network Transfer Manager. Assniffer recognizes most data being transferred over network, including FTP, HTTP, and other protocols. It captures the file name and file path for any network transfer, even if the name or path is modified by a program like Norton Commander or Explorer. It also captures the transferred data itself, and stores it. Assniffer has built-in support for saving files from Internet Explorer, allowing you to copy and save a file from Internet Explorer and continue work on it while offline. Assniffer Features: * Network monitor and logging (like tcpmon) that can capture all network transfers. * Multi-platform: * Windows: Windows XP, Windows Vista, Windows 7, Windows 8 * Linux: Ubuntu and Fedora * Java: * No install. Just run the jar file * Some advanced filtering is supported, such as filtering FTP transfers that open directories that don't contain a filename. * Captures data after the file is closed. Assniffer is not a copy tool. This is important if the file is modified while you

are offline. * Captures any file, including.exe and.zip. * Allows you to continue working on a file while offline. * Assniffer can monitor your own network, saving only data that you know of. * If you prefer the GUI, Assniffer allows you to use it without exiting your current program. * Graphical file listings from the host, whether you have a network connection or not. * Assniffer is a useful tool for those who want to gather information about how their computer or network works, or for those who want to access or modify data transferred over the Internet.
