reliable. 9. Quick conversion. 10. 100% protection for original HTML pages. 11. Easy to learn and operate. Protecting web sites with secure programs is critical to the security of the Internet. These programs use cryptography to make it impossible to read and modify the data being transmitted or stored. They are installed on your computer and on the web site to which you are connected. The details of how the security system works are published in standard Internet security protocols like the Secure Socket Layer (SSL) protocol and Transport Layer Security (TLS) protocol. HTTP allows you to send

web documents from your computer to a web server. HTTP uses the Hypertext Transfer Protocol (HTTP) to transfer the data. The web server stores the received data, which it then sends to the browser for rendering. The browser stores the data received from the server and transmits it to you for display. The browser is not required to use HTTP, and some browsers do not do so. In this case, the web server is completely dependent on the browser to send the data. The HTML, or Hypertext Markup Language, is the language used to describe the layout and contents of a web document. HTML

documents are the most common web documents. An HTML document contains Hypertext links, which are often displayed as words or images in the web document. A 2edc1e01e8
