A new approach to the design of a first-generation HIV drug-resistant virus by consensus algorithm. The use of viral populations in virus-host coevolution experiments has proven to be a powerful tool for studying the human immunodeficiency virus (HIV) mutation-selection balance, which is essential for viral drug resistance. There are many limitations to this type of approach, including: (1) a high cost of generating the consensus sequence of a drug-resistant mutant virus; (2) the possibility that another mutation may be selected during the passaging of the virus; and (3) the difficulty in reconstructing the exact nucleotides that were originally mutated to obtain the consensus sequence. We describe a consensus algorithm that uses sub-viral particles, which contain a mutant virus, as the initial population for a virus-host coevolution experiment. We first mutated a plasmid-based genome to a HIV-1 (NL4-3) strain. Next, we generated five different variants with a single mutation, and each variant with three successive mutations. Three variants were selected for in vitro experiments. The diversity of the consensus sequence of each variant was verified by heteroduplex mobility assay (HMA) and direct sequencing of PCR fragments. The variants with three mutations showed significantly higher drug resistance than did the mutants with two or one mutation, suggesting that consensus virus is a more accurate representation of the natural history of virus evolution. is also known as N-nitrosomethylbenzylamine (NMBzA). History Nitrosamines were discovered in 1899 by Henri Moissan. They were formerly called "enamine chlorides". The industrial production of nitrosamines began in the 1920s, when they were widely used as insecticides, herbicides, and fungicides. They were highly effective poisons that caused instant death in birds, fish, and insects, and their ban would not be lifted until the 1970s, when the carcinogenicity of nitrosamines was recognized. Cancers Nitrosamines have been found to be carcinogenic in animals, with an increasing number of studies confirming their carcinogenicity in
