Convex microgrooves with micrometer and submicrometer length scales are fabricated in poly(dimethylsiloxane) (PDMS) substrates and can be stacked by surface adhesion to form micrometer-scale conical particle stacks for particle-based optical and mechanical reinforcement. The proposed assembly was validated by observing shear-resisting behavior when loading convex microgrooves with various opening angles in a nanoindentation device. Axial assembly of convex microgrooves with an opening angle of $\sim 40^\circ$ generates particles with a tapered shape and a nanometer-scale contact patch width. A contact patch width of 50 nm or less can be achieved, which is $\sim 79a2804d6b$
