It was barely a month ago when Adobe finally rolled out its long-awaited update to Photoshop. The new update promises to fix a long list of problems, but it's also quick to do, and much easier than a full-blown update. Below, you'll find an in-depth review of the update, and also some advice for photographers getting ready to upgrade to Photoshop. We treat all of our reviews like we do our own, and our editors usually use it as a reloading point for the device from which the review was done. That means that the software can't be fully operational if there's no internet connection available, or cloud saves aren't enabled. At this point, I feel like I am raving about and venting about my many frustrations with the current version of Lightroom. Instead, I should go over a few of the more positive aspects that were highlighted by various users. For example, the "Adjustments" panel has been improved to make it much easier to manage. It is more intuitive, not to mention that there is plenty of space to preview the adjustments. Using the Quick Edit tool is also pretty convenient, especially if you want to make a few adjustments quickly. On the subject of adjustments, the recent implementation of brightening adjustment controls is also welcome. I am a big fan of LUTs and feel that it should be possible to utilize them in Lightroom, but I was starting to get tired of locating the right color profile and downloading a new one. I am not sure how to make certain that the LUT I am using is actually working, but merging color profile information into a JPEG file did make it easier. Another thing I really appreciate is how easy it is to create and store camera profiles in Lightroom. It was so, so much easier than merging color profiles and I certainly look forward to the analytics features that have been developed for camera profile selection. The handling of spot healing is another matter that I find more convenient. It is a lot easier to do than with Photoshop. A particularly useful feature is the ability to create brushes to apply these spot healing efforts. I would very much like to see Lightroom offer software that allowed me to perform more complex spot healing operations. Maybe a Content Aware Spot Healing tool. On top of that, I love the landscape slider for Cropping that Lightroom provides. A simple way to remove unwanted areas of an image would definitely be welcomed. So, the landscape slider is great since you can easily remove more than you were planning on. You can crop an image to the size of the final piece, for example. The resulting piece won't always look average, but it will still end up with the proportions of the original image. Those are definitely the main features where Lightroom shines these days, but I would like users to be a bit more pleasantly surprised by the speed. That, however, is just my opinion.

Smart Objects are an optional method of organizing layers, groups, and filters. Layers can be grouped when certain filtering is used on the layer. For instance, you can have an image open along with a bunch of layers that are part of the group. Then, you can change the effects, use a layer mask, or add layer styles to the group and only the filters applied to that group will take effect. You can make layer styles all by themselves, but it's more common to apply them to a smart object. To create a smart object, go to Layer>New>Smart Object. Most of the time, you don't need a smart object because all you need is one or a few layers, but using a smart object can save you a ton of time when organizing layers. For example, if you wanted to incorporate a lime green color in a document or a picture, you'd be able to do so with a touch of green. If you use the Liquify tool, you can stretch layers around a corner and add or remove details. You can even stretch a logo and add some movement with the blemish tool. The beta lets you use the camera to capture images, videos, and artwork. If you create, manipulate, and save artwork in Photoshop, you will be able to apply the new color filters—like Vintage, Emulate historic colors, and Black and White—to your images in the browser.

Photoshop now offers a new type of color organization system, called a **color guide.** Color guides help you define and guide your color selection, whether you're looking to change the color of parts of an image, select a specific hue of a color, or even find a competitor's color and choose the best one. Color guides are an essential tool whenever you work with colors. The latest updates in the Web Platform also make it easier to use Photoshop on macOS or Windows. All of this comes as part of Photoshop's Camera app for iOS devices. 933d7f57e6
