What's New In K-Rename?

The K-Rename application was designed to be a small command line tool that will help you rename files according to custom pattern. Useful for processing archives of raw images from your digital camera or music files. K-Rename is a free, open-source, command-line tool for renaming files and/or folders. K-Rename is a command line tool developed by Mark Russinovich, Sysinternals division and it runs under Windows. Features K-Rename is a free, open-source command-line tool for renaming files and/or folders. The tool is primarily designed for archiving and image optimization. To name a few: Directories and files naming according to any custom pattern Moved to another folder Deleted Hardlink for duplicate files Hidden files and directories are excluded. Name change of files for security reasons, such as removing the original file's extension Compress files to save disk space Rename files without moving them to their

destination folder, they will be only renamed and only the file's filename will change.

Quick access to the files

Convert images to different formats

Strip unwanted spaces from file names

Run under Windows and Linux

The tool can be integrated into other programs and applications, for example:

Process images by inserting them to the EXIF orientation tag

Replace the original files in Windows Explorer with the backup files

Q: Bash script (with AWK) - keeping repeated results of shell command in variable

I have a bash script which gets: input from stdin and passes it to a shell command the output of the shell command is stored in a variable

I'd like to be able to get all the output of the shell command in my variable; and I want the results of the shell command to remain in the variable until I clear the variable (by deleting it).

I've tried the following, but the output of the shell command remains in the variable until the script ends:

```
#!/bin/bash
read -p "please enter string: " input
echo $input | egrep "WordToSearch"
```

(I just used egrep, but I'd like to find all matches of the input string.)

I want to use this as a filter, but if I run the script twice, it will look for the same string again; and it will only output the latest search (and the rest of the data is lost.)

I think this might be caused by the read line

System Requirements:

MAC OS: OS X 10.8 or later Windows: Windows 7 or later Console: Original Xbox HDMI
Internet Connection: On-line Connection Additional Notes: * Game requires the Xbox
Live Arcade & Games with Gold titles as part of the Arcade Pack subscription * The
arcade versions of Decodecs titles are free to download * Purchase the titles to unlock
access to all of the content in the main game and the arcade versions. * This
