One other thing to note about Lightroom is that it is even less dependent than the other Adobe apps on plug-ins, like the other ones I use. What's so wonderful about Lightroom is that it creates the image files right there on the computer. If you want to save one as a PNG or JPEG, you select the file type and right-click to open it in your preferred program. If you are editing a RAW file, you can use the built-in Lightroom tools to smooth, rotate, adjust colors, remove red-eye, etc. Of course, you can use the menu items if you want to, but you can also export the file and use the command line to process it. You can also use the command line to create custom presets for faster image editing. The built-in editing tools offer many of the same adjustment options as Photoshop, such as Levels, Curves, Channel Mixer, Sharpen, Blur, B&W, and others. This release is no mere update, but a comprehensive relaunch of the popular photo-editing program. From the perspective of a casual user, it doesn't look all that different, which is a good thing – let's face it, this was a far more attractive program back in days of yore. But the look and feel, plus the way it works, make it one of the more powerful and useful photo-editing apps out there. Adobe has launched a new version of Photoshop that's less expensive than its previous release, but it has the same powerful tools and editing features. It's still priced at a smart $495 (at the time of this writing) for the entry-level CC edition (the standard edition costs $1950), or $600 for its creative CC edition (the standard edition price jumps up to $2450). Effectively, you're getting the premium version of the program for half the price.
