The solution I found is for probability and I don't understand how it's computed. For a given key, why is the probability to start with the first number P(2) and to be followed by any number of an unknown character θ , $P(2)(\theta)$? The solution says that it's 2 because 2 is the only number starting with 2. Why is this the case? And what's the notation for all the probabilities with the obvious one? A: Let's put our hands on it Let's start by computing the probability of the second digit of a given key to be \$2\$. You're given that there are \$5\$ possible values for the first digit, namely \$1,2,3,4,5\$; the second digit can then assume one of the values \$1,2,3,4,5\$ also; so the key is essentially uniformly distributed over the \$10\$ possibilities. Then we now want to compute the probability of the "second" digit. This depends on the case in which it is the second digit of the key, and in which it is not. Let's try both cases: Case 1: $\Pr(\text{second digit is } 2) = \frac{1}{5} \cdot \frac{1}{4} = \frac{1}{20}$ Case 2: $\Pr(\text{second digit is$
