Even with Photoshop's excellent built-in brushes, I often turn to third-party apps like Blackmartin Brushes and AfterImage for more variety (see the article for a roundup of my favorite third-party brushes). However, my friend, Keith McBreen, just has a point about one of those: Photoshop can be “the knot in your neck.” APPS: Photoshop Portfolio 4 has added two new, must-have features: a history stack and browser. A history stack organizes your projects into a stack view—a simple vertical list that lets you quickly go back in your creative projects. What web technologies enable Photoshop to run inside the browser?

The web-browser version of Photoshop uses WebAssembly. WebAssembly is a lightweight web technology that closely replicates native applications. WebAssembly applications can make use of the entire set of features and functionality of modern browsers. The new public beta release of Photoshop can be used via the .CS2X Wasm environment. The environment is a special version of web-browser that allows us to safely run large applications in the web. The environment is designed to run the cs2x builtin Web Assembly language (wasm) along with an abstracted DOM API. The wasm file and DOM API are provided through a special `amp-accessor` meta tag. The `amp-accessor` tag makes it possible to load ported.cs2x files using standard HTML. This means that users of macOS Catalina, Windows or Android devices can load Photoshop directly in their web browsers. And, thanks to advancements in software developer tools such as Service Workers, webworkers and GMP, Photoshop already works even without the use of WebAssembly.
