A: Some magic with awk should do the trick: awk '{ print \$9 }' outfile A: Use grep: grep -P -o -n '($[^{.}]$ *).' infile > outfile This finds any line that contains a. in it, then it captures the filename part of the line. For the rest of the line, it just prints the content. A: Using awk As explained in the comments under the original question, your file can be processed efficiently using awk. For example \$ echo 'A.txt . B.txt C.txt' | awk -F. $\$1\sim \land .txt\$/ \{print \$1\}' A.txt The -F. says that$ whenever the awk program sees a period, it should remove the period from it. (Normally periods mark the end of a field (from the specific chars) in awk. This -F. tells awk to ignore anything that is a period.) The $1\sim \.$ txt\$/ matches anything that is in the first field (the whole line) that is followed by a period and then a string that ends with.txt. The regex part is a bit tricker. ^ means "not", so what this is saying is that the first field does not start with anything that is a period and then a string that ends with.txt. That's actually more complicated, but this prints the whole thing. There

is a more efficient way to do this which is awk '{print FILENAME}' but I will stick with the example for simplicity. The same thing can be accomplished in another way: awk '{print \$1}' infile > outfile Q: Calling a functor when nothing is bound to a variable in Java? I had a method in C
